Gene Information	
Gene Official Full Name	actin related protein 3B provided by HGNC
Also known as	ARP11; ARP3BETA
Gene Description	This gene encodes a member of the actin-related proteins (ARP), which form multiprotein complexes and share 35-55% amino acid identity with conventional actin. The protein encoded by this gene may have a regulatory role in the actin cytoskeleton and induce cell-shape change and motility. Pseudogenes of this gene are located on chromosomes 2, 4, 10, 16, 22 and Y. Alternative splicing results in multiple transcript variants and protein isoforms. [provided by RefSeq, Jul 2012]
Expression	Broad expression in brain (RPKM 3.7), testis (RPKM 1.9) and 25 other tissues See more
