Gene Information	
Gene Official Full Name	NFKB repressing factorprovided by HGNC
Also known as	NRF; ITBA4
Gene Description	This gene encodes a transcriptional repressor that interacts with specific negative regulatory elements to mediate transcriptional repression of certain nuclear factor kappa B responsive genes. The protein localizes predominantly to the nucleolus with a small fraction found in the nucleoplasm and cytoplasm. Alternate splicing results in multiple transcript variants. [provided by RefSeq, Mar 2010]
Expression	Ubiquitous expression in brain (RPKM 6.5), lymph node (RPKM 4.2) and 25 other tissues See more
