Gene Information	
Gene Official Full Name	grancalcin provided by HGNC
Also known as	GCL
Gene Description	This gene encodes a calcium-binding protein that is abundant in neutrophils and macrophages. In the absence of divalent cation, this protein localizes to the cytosolic fraction; with magnesium alone, it partitions with the granule fraction; and in the presence of magnesium and calcium, it associates with both the granule and membrane fractions. Alternative splicing and use of alternative promoters results in multiple transcript variants. [provided by RefSeq, Aug 2016]
Expression	Broad expression in bone marrow (RPKM 47.3), appendix (RPKM 18.4) and 18 other tissues See more
