Gene Information	
Gene Official Full Name	TRAF2 and NCK interacting kinase provided by HGNC
Also known as	MRT54
Gene Description	Wnt signaling plays important roles in carcinogenesis and embryonic development. The protein encoded by this gene is a serine/threonine kinase that functions as an activator of the Wnt signaling pathway. Mutations in this gene are associated with an autosomal recessive form of cognitive disability. Alternative splicing results in multiple transcript variants encoding different isoforms. [provided by RefSeq, Jul 2017]
Expression	Broad expression in brain (RPKM 10.5), small intestine (RPKM 7.1) and 20 other tissues See more
