Gene Information	
Gene Official Full Name	plakophilin 3provided by HGNC
Gene Description	This gene encodes a member of the arm-repeat (armadillo) and plakophilin gene families. Plakophilin proteins contain numerous armadillo repeats, localize to cell desmosomes and nuclei, and participate in linking cadherins to intermediate filaments in the cytoskeleton. This protein may act in cellular desmosome-dependent adhesion and signaling pathways. Two transcript variants encoding different isoforms have been found for this gene. [provided by RefSeq, Dec 2014]
Expression	Biased expression in skin (RPKM 51.4), esophagus (RPKM 46.7) and 11 other tissues See more
