Gene Information	
Gene Official Full Name	X-ray repair cross complementing 4 provided by HGNC
Also known as	SSMED; hXRCC4
Gene Description	The protein encoded by this gene functions together with DNA ligase IV and the DNA-dependent protein kinase in the repair of DNA double-strand breaks. This protein plays a role in both non-homologous end joining and the completion of V(D)J recombination. Mutations in this gene can cause short stature, microcephaly, and endocrine dysfunction (SSMED). Alternate transcript variants such as NM_022406 are unlikely to be expressed in some individuals due to a polymorphism (rs1805377) in the last splice acceptor site. [provided by RefSeq, Oct 2019]
Expression	Ubiquitous expression in testis (RPKM 2.7), lymph node (RPKM 2.1) and 25 other tissues See more
