Gene Information	
Gene Official Full Name	drebrin 1 provided by HGNC
Also known as	D0S117E
Gene Description	The protein encoded by this gene is a cytoplasmic actin-binding protein thought to play a role in the process of neuronal growth. It is a member of the drebrin family of proteins that are developmentally regulated in the brain. A decrease in the amount of this protein in the brain has been implicated as a possible contributing factor in the pathogenesis of memory disturbance in Alzheimer's disease. At least two alternative splice variants encoding different protein isoforms have been described for this gene. [provided by RefSeq, Jul 2008]
Expression	Ubiquitous expression in endometrium (RPKM 21.1), brain (RPKM 16.5) and 24 other tissues See more
