Gene Information	
Gene Official Full Name	GLIS family zinc finger 3provided by HGNC
Also known as	NDH; ZNF515
Gene Description	This gene is a member of the GLI-similar zinc finger protein family and encodes a nuclear protein with five C2H2-type zinc finger domains. This protein functions as both a repressor and activator of transcription and is specifically involved in the development of pancreatic beta cells, the thyroid, eye, liver and kidney. Mutations in this gene have been associated with neonatal diabetes and congenital hypothyroidism (NDH). Alternatively spliced variants that encode different protein isoforms have been described but the full-length nature of only two have been determined. [provided by RefSeq, Jul 2008]
Expression	Biased expression in thyroid (RPKM 8.8), gall bladder (RPKM 2.6) and 13 other tissues See more
