Gene Information	
Gene Official Full Name	GRB2 associated binding protein 3provided by HGNC
Gene Description	This gene is a member of the GRB2-associated binding protein gene family. These proteins are scaffolding/docking proteins that are involved in several growth factor and cytokine signaling pathways, and they contain a pleckstrin homology domain, and bind SHP2 tyrosine phosphatase and GRB2 adapter protein. The protein encoded by this gene facilitates macrophage differentiation. Alternative splicing results in multiple transcript variants. [provided by RefSeq, Aug 2013]
Expression	Broad expression in spleen (RPKM 7.6), bone marrow (RPKM 4.4) and 22 other tissues See more
