Gene Information	
Gene Official Full Name	nucleoporin 35provided by HGNC
Also known as	MP44; NP44; MP-44; NUP53
Gene Description	This gene encodes a member of the nucleoporin family. The encoded protein contains two membrane binding regions, is localized to the nuclear rim, and is part of the nuclear pore complex. All molecules entering or leaving the nucleus either diffuse through or are actively transported by the nuclear pore complex. Alternative splicing results in multiple transcript variants. Pseudogenes of this gene have been defined on chromosomes 7 and 10. [provided by RefSeq, Dec 2013]
Expression	Ubiquitous expression in testis (RPKM 6.9), adrenal (RPKM 3.5) and 25 other tissues See more
