Gene Information	
Gene Official Full Name	dermokineprovided by HGNC
Also known as	UNQ729; ZD52F10
Gene Description	This gene is upregulated in inflammatory diseases, and it was first observed as expressed in the differentiated layers of skin. The most interesting aspect of this gene is the differential use of promoters and terminators to generate isoforms with unique cellular distributions and domain components. Alternatively spliced transcript variants encoding different isoforms have been identified for this gene. [provided by RefSeq, Jun 2010]
Expression	Biased expression in skin (RPKM 387.3) and esophagus (RPKM 47.0) See more
