Gene Information	
Gene Official Full Name	protein kinase D2provided by HGNC
Also known as	PKD2; HSPC187; nPKC-D2
Gene Description	The protein encoded by this gene belongs to the protein kinase D (PKD) family of serine/threonine protein kinases. This kinase can be activated by phorbol esters as well as by gastrin via the cholecystokinin B receptor (CCKBR) in gastric cancer cells. It can bind to diacylglycerol (DAG) in the trans-Golgi network (TGN) and may regulate basolateral membrane protein exit from TGN. Alternative splicing results in multiple transcript variants encoding different isoforms. [provided by RefSeq, Jul 2008]
Expression	Ubiquitous expression in spleen (RPKM 19.7), lymph node (RPKM 14.5) and 25 other tissues See more
