Gene Information	
Gene Official Full Name	RAD54 homolog Bprovided by HGNC
Also known as	RDH54
Gene Description	The protein encoded by this gene belongs to the DEAD-like helicase superfamily. It shares similarity with <i>Saccharomyces cerevisiae</i> RAD54 and RDH54, both of which are involved in homologous recombination and repair of DNA. This protein binds to double-stranded DNA, and displays ATPase activity in the presence of DNA. This gene is highly expressed in testis and spleen, which suggests active roles in meiotic and mitotic recombination. Homozygous mutations of this gene were observed in primary lymphoma and colon cancer. [provided by RefSeq, Jul 2008]
Expression	Ubiquitous expression in testis (RPKM 1.8), prostate (RPKM 1.3) and 25 other tissues See more
