Gene Information	
Gene Official Full Name	src kinase associated phosphoprotein 1provided by HGNC
Also known as	SCAP1; SKAP55; HEL-S-81p
Gene Description	This gene encodes a T cell adaptor protein, a class of intracellular molecules with modular domains capable of recruiting additional proteins but that exhibit no intrinsic enzymatic activity. The encoded protein contains a unique N-terminal region followed by a PH domain and C-terminal SH3 domain. Along with the adhesion and degranulation-promoting adaptor protein, the encoded protein plays a critical role in inside-out signaling by coupling T-cell antigen receptor stimulation to the activation of integrins. Expression	Broad expression in lymph node (RPKM 9.4), spleen (RPKM 4.5) and 17 other tissues See more
