Gene Information	
Gene Official Full Name	myosin VIprovided by HGNC
Also known as	DFNA22; DFNB37
Gene Description	This gene encodes a reverse-direction motor protein that moves toward the minus end of actin filaments and plays a role in intracellular vesicle and organelle transport. The protein consists of a motor domain containing an ATP- and an actin-binding site and a globular tail which interacts with other proteins. This protein maintains the structural integrity of inner ear hair cells and mutations in this gene cause non-syndromic autosomal dominant and recessive hearing loss. Alternative splicing results in multiple transcript variants encoding distinct isoforms. [provided by RefSeq, Jul 2014]
Expression	Broad expression in kidney (RPKM 22.2), duodenum (RPKM 13.0) and 23 other tissues See more
