Gene Information	
Gene Official Full Name	3-ketodihydrosphingosine reductaseprovided by HGNC
Also known as	DHSR; FVT1; EKVP4; SDR35C1
Gene Description	The protein encoded by this gene catalyzes the reduction of 3-ketodihydrosphingosine to dihydrosphingosine. The putative active site residues of the encoded protein are found on the cytosolic side of the endoplasmic reticulum membrane. A chromosomal rearrangement involving this gene is a cause of follicular lymphoma, also known as type II chronic lymphatic leukemia. The mutation of a conserved residue in the bovine ortholog causes spinal muscular atrophy. [provided by RefSeq, Jul 2008]
Expression	Ubiquitous expression in ovary (RPKM 14.9), skin (RPKM 11.7) and 25 other tissues See more
