Gene Information

Gene Official Full Name	ferrochelataseprovided by HGNC
Also known as	EPP; FCE; EPP1
Gene Description	The protein encoded by this gene is localized to the mitochondrion, where it catalyzes the insertion of the ferrous form of iron into protoporphyrin IX in the heme synthesis pathway. Mutations in this gene are associated with erythropoietic protoporphyria. Two transcript variants encoding different isoforms have been found for this gene. A pseudogene of this gene is found on chromosome 3.[provided by RefSeq, May 2010]
Expression	Broad expression in bone marrow (RPKM 19.5), kidney (RPKM 8.4) and 24 other tissues See more
