Gene Information	
Gene Official Full Name	two pore segment channel 2provided by HGNC
Also known as	TPC2; SHEP10
Gene Description	This gene encodes a putative cation-selective ion channel with two repeats of a six-transmembrane-domain. The protein localizes to lysosomal membranes and enables nicotinic acid adenine dinucleotide phosphate (NAADP) -induced calcium ion release from lysosome-related stores. This ubiquitously expressed gene has elevated expression in liver and kidney. Two common nonsynonymous SNPs in this gene strongly associate with blond versus brown hair pigmentation.[provided by RefSeq, Dec 2009]
Expression	Ubiquitous expression in skin (RPKM 3.4), endometrium (RPKM 3.2) and 25 other tissues See more
