Gene Information	
Gene Official Full Name	tripartite motif containing 7provided by HGNC
Also known as	GNIP; RNF90
Gene Description	The protein encoded by this gene is a member of the tripartite motif (TRIM) family. The TRIM motif includes three zinc-binding domains, a RING, a B-box type 1, a B-box type 2, and a coiled-coil region. The protein localizes to both the nucleus and the cytoplasm, and may represent a participant in the initiation of glycogen synthesis. Alternative splicing results in multiple transcript variants. [provided by RefSeq, Jul 2013]
Expression	Biased expression in skin (RPKM 5.6), esophagus (RPKM 2.8) and 8 other tissues See more
