Gene Information	
Gene Official Full Name	FOS like 1, AP-1 transcription factor subunitprovided by HGNC
Also known as	FRA; FRA1; fra-1
Gene Description	The Fos gene family consists of 4 members: FOS, FOSB, FOSL1, and FOSL2. These genes encode leucine zipper proteins that can dimerize with proteins of the JUN family, thereby forming the transcription factor complex AP-1. As such, the FOS proteins have been implicated as regulators of cell proliferation, differentiation, and transformation. Several transcript variants encoding different isoforms have been found for this gene. [provided by RefSeq, Jul 2014]
Expression	Biased expression in gall bladder (RPKM 16.7), urinary bladder (RPKM 10.2) and 13 other tissues See more
