Gene Information	
Gene Official Full Name	latent transforming growth factor beta binding protein 3provided by HGNC
Also known as	DASS; LTBP2; LTBP-3; STHAG6; pp6425; GPHYSD3
Gene Description	The protein encoded by this gene forms a complex with transforming growth factor beta (TGF-beta) proteins and may be involved in their subcellular localization. Activation of this complex requires removal of the encoded binding protein. This protein also may play a structural role in the extracellular matrix. Three transcript variants encoding different isoforms have been found for this gene.[provided by RefSeq, Jan 2010]
Expression	Ubiquitous expression in ovary (RPKM 27.2), fat (RPKM 25.7) and 25 other tissues See more
