Gene Information	
Gene Official Full Name	serine protease 8provided by HGNC
Also known as	CAP1; PROSTASIN
Gene Description	This gene encodes a member of the peptidase S1 or chymotrypsin family of serine proteases. The encoded preproprotein is proteolytically processed to generate light and heavy chains that associate via a disulfide bond to form the heterodimeric enzyme. This enzyme is highly expressed in prostate epithelia and is one of several proteolytic enzymes found in seminal fluid. This protease exhibits trypsin-like substrate specificity, cleaving protein substrates at the carboxyl terminus of lysine or arginine residues. The encoded protease partially mediates proteolytic activation of the epithelial sodium channel, a regulator of sodium balance, and may also play a role in epithelial barrier formation. Expression	Broad expression in small intestine (RPKM 73.7), colon (RPKM 73.6) and 14 other tissues See more
