Gene Information	
Gene Official Full Name	phosphodiesterase 6Gprovided by HGNC
Also known as	PDEG; RP57
Gene Description	This gene encodes the gamma subunit of cyclic GMP-phosphodiesterase, which is composed of alpha- and beta- catalytic subunits and two identical, inhibitory gamma subunits. This gene is expressed in rod photoreceptors and functions in the phototransduction signaling cascade. It is also expressed in a variety of other tissues, and has been shown to regulate the c-Src protein kinase and G-protein-coupled receptor kinase 2. Alternative splicing results in multiple transcript variants. [provided by RefSeq, Feb 2009]
Expression	Biased expression in spleen (RPKM 3.3), lymph node (RPKM 1.9) and 12 other tissues See more
