Gene Information	
Gene Official Full Name	FLII actin remodeling proteinprovided by HGNC
Also known as	FLI; FLIL; Fli1; CMD2J
Gene Description	This gene encodes a protein with a gelsolin-like actin binding domain and an N-terminal leucine-rich repeat-protein protein interaction domain. The protein is similar to a Drosophila protein involved in early embryogenesis and the structural organization of indirect flight muscle. The gene is located within the Smith-Magenis syndrome region on chromosome 17. [provided by RefSeq, Jul 2008]
Expression	Ubiquitous expression in testis (RPKM 32.8), spleen (RPKM 32.4) and 25 other tissues See more
