Gene Information	
Gene Official Full Name	calbindin 2provided by HGNC
Also known as	CR; CAL2; CAB29
Gene Description	This gene encodes an intracellular calcium-binding protein belonging to the troponin C superfamily. Members of this protein family have six EF-hand domains which bind calcium. This protein plays a role in diverse cellular functions, including message targeting and intracellular calcium buffering. It also functions as a modulator of neuronal excitability, and is a diagnostic marker for some human diseases, including Hirschsprung disease and some cancers. Alternative splicing results in multiple transcript variants. [provided by RefSeq, Jun 2010]
Expression	Biased expression in fat (RPKM 72.8), testis (RPKM 20.4) and 4 other tissues See more
