Gene Information	
Gene Official Full Name	thrombospondin 3provided by HGNC
Also known as	TSP3
Gene Description	The protein encoded by this gene belongs to the thrombospondin family. Thrombospondin family members are adhesive glycoproteins that mediate cell-to-cell and cell-to-matrix interactions. This protein forms a pentameric molecule linked by a single disulfide bond. This gene shares a common promoter with metaxin 1. Alternate splicing results in coding and non-coding transcript variants. [provided by RefSeq, Nov 2011]
Expression	Ubiquitous expression in endometrium (RPKM 9.2), gall bladder (RPKM 7.8) and 25 other tissues See more
