Gene Information	
Gene Official Full Name	p21 (RAC1) activated kinase 2 provided by HGNC
Also known as	KNO2; PAK65; PAKgamma
Gene Description	The p21 activated kinases (PAK) are critical effectors that link Rho GTPases to cytoskeleton reorganization and nuclear signaling. The PAK proteins are a family of serine/threonine kinases that serve as targets for the small GTP binding proteins, CDC42 and RAC1, and have been implicated in a wide range of biological activities. The protein encoded by this gene is activated by proteolytic cleavage during caspase-mediated apoptosis, and may play a role in regulating the apoptotic events in the dying cell. Expression	Ubiquitous expression in spleen (RPKM 22.2), appendix (RPKM 21.0) and 25 other tissues See more
