Gene Information	
Gene Official Full Name	FAM111 trypsin like peptidase Bprovided by HGNC
Also known as	CANP; POIKTMP
Gene Description	This gene encodes a protein with a trypsin-like cysteine/serine peptidase domain in the C-terminus. Mutations in this gene are associated with an autosomal dominant form of hereditary fibrosing poikiloderma (HFP). Affected individuals display mottled pigmentation, telangiectasia, epidermal atrophy, tendon contractures, and progressive pulmonary fibrosis. Alternative splicing results in multiple transcript variants encoding distinct isoforms. A paralog of this gene which also has a trypsin-like peptidase domain, FAM111A, is located only 16 kb from this gene on human chromosome 11q12.1. [provided by RefSeq, Apr 2014]
Expression	Broad expression in lymph node (RPKM 4.9), appendix (RPKM 2.8) and 17 other tissues See more
