Gene Information	
Gene Official Full Name	dihydrouridine synthase 2provided by HGNC
Also known as	SMM1; DUS2L; URLC8
Gene Description	This gene encodes a cytoplasmic protein that catalyzes the conversion of uridine residues to dihydrouridine in the D-loop of tRNA. The resulting modified bases confer enhanced regional flexibility to tRNA. The encoded protein may increase the rate of translation by inhibiting an interferon-induced protein kinase. This gene has been implicated in pulmonary carcinogenesis. Alternatively spliced transcript variants have been described for this gene. [provided by RefSeq, Nov 2012]
Expression	Broad expression in testis (RPKM 12.7), lymph node (RPKM 5.7) and 24 other tissues See more
