Gene Information	
Gene Official Full Name	angiomotin like 2provided by HGNC
Also known as	LCCP
Gene Description	Angiomotin is a protein that binds angiotatin, a circulating inhibitor of the formation of new blood vessels (angiogenesis). Angiomotin mediates angiotatin inhibition of endothelial cell migration and tube formation in vitro. The protein encoded by this gene is related to angiomotin and is a member of the motin protein family. Alternative splicing results in multiple transcript variants of this gene. [provided by RefSeq, Jul 2013]
Expression	Ubiquitous expression in fat (RPKM 33.7), placenta (RPKM 20.8) and 24 other tissues See more
