Gene Information	
Gene Official Full Name	CD2 associated protein provided by HGNC
Also known as	CMS
Gene Description	This gene encodes a scaffolding molecule that regulates the actin cytoskeleton. The protein directly interacts with filamentous actin and a variety of cell membrane proteins through multiple actin binding sites, SH3 domains, and a proline-rich region containing binding sites for SH3 domains. The cytoplasmic protein localizes to membrane ruffles, lipid rafts, and the leading edges of cells. It is implicated in dynamic actin remodeling and membrane trafficking that occurs during receptor endocytosis and cytokinesis. Haploinsufficiency of this gene is implicated in susceptibility to glomerular disease. [provided by RefSeq, Jul 2008]
Expression	Ubiquitous expression in small intestine (RPKM 31.9), duodenum (RPKM 29.7) and 25 other tissues See more
