Gene Information	
Gene Official Full Name	heterogeneous nuclear ribonucleoprotein Rprovided by HGNC
Also known as	HNRPR; NEDDFSB; hnRNP-R
Gene Description	This gene encodes an RNA-binding protein that is a member of the spliceosome C complex, which functions in pre-mRNA processing and transport. The encoded protein also promotes transcription at the c-fos gene. Alternative splicing results in multiple transcript variants. There are pseudogenes for this gene on chromosomes 4, 11, and 10. [provided by RefSeq, Jul 2014]
Expression	Ubiquitous expression in lymph node (RPKM 17.7), appendix (RPKM 17.6) and 25 other tissues See more
