Gene Information	
Gene Official Full Name	NCK adaptor protein 2 provided by HGNC
Also known as	GRB4; NCKbeta
Gene Description	This gene encodes a member of the NCK family of adaptor proteins. The protein contains three SH3 domains and one SH2 domain. The protein has no known catalytic function but has been shown to bind and recruit various proteins involved in the regulation of receptor protein tyrosine kinases. It is through these regulatory activities that this protein is believed to be involved in cytoskeletal reorganization. Alternate transcriptional splice variants, encoding different isoforms, have been characterized. [provided by RefSeq, Jul 2008]
Expression	Ubiquitous expression in duodenum (RPKM 14.7), spleen (RPKM 14.6) and 25 other tissues See more
