Gene Information	
Gene Official Full Name	programmed cell death 10provided by HGNC
Also known as	CCM3; TFAR15
Gene Description	This gene encodes an evolutionarily conserved protein associated with cell apoptosis. The protein interacts with the serine/threonine protein kinase MST4 to modulate the extracellular signal-regulated kinase (ERK) pathway. It also interacts with and is phosphorylated by serine/threonine kinase 25, and is thought to function in a signaling pathway essential for vascular development. Mutations in this gene are one cause of cerebral cavernous malformations, which are vascular malformations that cause seizures and cerebral hemorrhages. Multiple alternatively spliced variants, encoding the same protein, have been identified. [provided by RefSeq, Jul 2008]
Expression	Ubiquitous expression in colon (RPKM 13.1), lymph node (RPKM 11.6) and 25 other tissues See more
