Gene Information	
Gene Official Full Name	YY1 associated factor 2 provided by HGNC
Gene Description	This gene encodes a zinc finger containing protein that functions in the regulation of transcription. This protein was identified as an interacting partner of transcriptional repressor protein Yy1, and also interacts with other transcriptional regulators, including Myc and Polycomb. This protein can promote proteolysis of Yy1. Multiple alternatively spliced transcript variants have been found. [provided by RefSeq, Feb 2016]
Expression	Ubiquitous expression in heart (RPKM 3.8), brain (RPKM 3.3) and 25 other tissues See more
