Gene Information	
Gene Official Full Name	NCK adaptor protein 1 provided by HGNC
Also known as	NCK; nck-1; NCKalpha
Gene Description	The protein encoded by this gene is one of the signaling and transforming proteins containing Src homology 2 and 3 (SH2 and SH3) domains. It is located in the cytoplasm and is an adaptor protein involved in transducing signals from receptor tyrosine kinases to downstream signal recipients such as RAS. Alternatively spliced transcript variants encoding different isoforms have been found. [provided by RefSeq, Jun 2010]
Expression	Ubiquitous expression in lymph node (RPKM 10.1), fat (RPKM 9.3) and 25 other tissues See more
