Gene Information	
Gene Official Full Name	dopamine receptor D2 provided by HGNC
Also known as	D2R; D2DR
Gene Description	This gene encodes the D2 subtype of the dopamine receptor. This G-protein coupled receptor inhibits adenylyl cyclase activity. A missense mutation in this gene causes myoclonus dystonia; other mutations have been associated with schizophrenia. Alternative splicing of this gene results in two transcript variants encoding different isoforms. A third variant has been described, but it has not been determined whether this form is normal or due to aberrant splicing. [provided by RefSeq, Jul 2008]
Expression	Biased expression in adrenal (RPKM 4.1), endometrium (RPKM 0.7) and 3 other tissues See more
